Adding a mezzanine to your facility can feel like a big undertaking. With all the considerations between the different types of mezzanines, flooring, construction and accessories, you and your team will have to take a full assessment of your operational needs and warehouse layout.

STEEL MEZZANINES

As your company grows, so does the need for floor space and storage. Installing Steel Mezzanines in your facility can practically double your usable space. This new level can provide you with more storage or office space, while leaving a minimal footprint on the floor below.

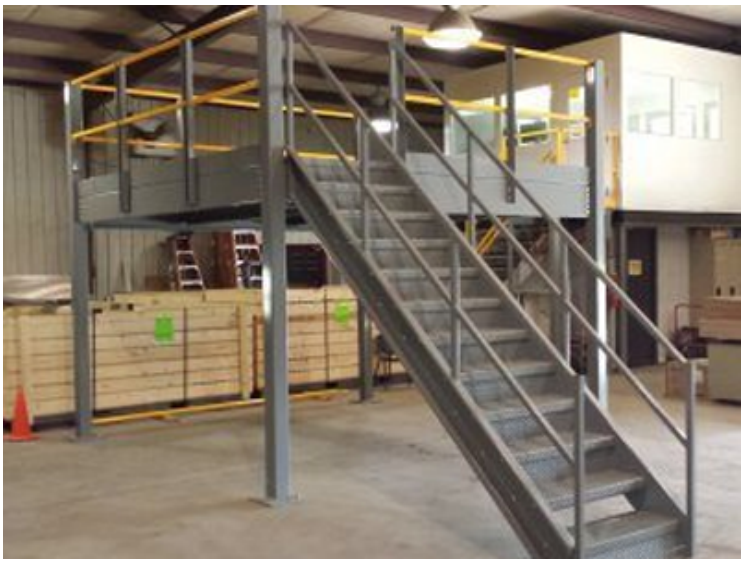
EQUIPMENT PLATFORMS

Equipment Platforms allow direct, easy access to the machinery for maintenance, operation, and more. These can be designed to completely encapsulate your equipment or tank without reducing the structural integrity of the platform's decking.

CATWALK MEZZANINES

Steel catwalks create convenient equipment access and foot-traffic solutions for your facility. They can be designed, manufactured, and installed to span from one side of your facility to the other. These systems can also be used to reduce foot traffic on the facility floor or as platforms to run a conveyor system across.

COLD ROLL MEZZANINES



A cold rolled mezzanine refers to the method of bending sheet metal into C-channel to use as the understructure of the mezzanine floor. These cold-rolled pieces attach to the tubular steel or tapered columns and provide the “beams” that support the floor. Cold rolled has two major benefits over structural steel mezzanines. The material is much lighter than structural steel, reducing shipping and installation costs. Cold Roll steel can be pre-galvanized; offering substantial savings over hot-dipped galvanized, stainless steel, or aluminum mezzanines.

RACK-SUPPORTED MEZZANINES

Shelving-supported mezzanines and rack-supported mezzanines are another popular option. In these configurations, also known as deck-over shelving, the existing shelving or racks underneath the deck offer the structural support for the mezzanine. This means you won’t need to install specific structural columns for the mezzanine itself.

Shelving-supported and rack-supported mezzanine systems can offer a lot to facilities with already densely packed storage. They help maximize storage space by providing shelving or racking underneath and additional space on top.

There's a lot you need to consider when it comes to mezzanines, so contact your local Indoff Material Handling Sales Representative to find out more about all the styles available as well as the thousands of other products they can supply.
